🚩 A kérdés
megjelölése

Consider a 6-month futures contract on an index. Suppose that the stocks underlying the index provide a dividend yield of 6% per annum (continuously compounded), that the current value of the index is 3000, and the continuously compounded risk-free rate is 10% per annum. The futures price for a contract deliverable in 6 months is 3150. What arbitrage strategy does this imply?

- ☐ a. 6-month short futures + long underlying + 6-month long zero-coupon bond
- ☒ b. 6-month short futures + long underlying + 6-month short zero-coupon bond ✓
- ☐ c. 6-month long futures + short underlying + 6-month short zero-coupon bond
- ☐ d. 6-month long futures + short underlying + 3-month long zero-coupon bond

Válasza helyes.

A helyes válasz:

6-month short futures + long underlying + 6-month short zero-coupon bond

megjelölése

How do you estimate the industry (unleveraged) cost of capital?

- ☒ a. We estimate the β_A by regressing the performance of an industry-specific share portfolio against the market portfolio returns. Next, we can use the CAPM formula to get r_A . ✗
- ☐ b. We calculate the average r_E and r_D for the peers, and using the average D/V ratio, we can calculate the r_A for the industry by applying the Miller-Modigliani formula.
- ☐ c. For each of the peers, we deleverage their r_E , and calculate the average of those.
- ☐ d. For each of the peers, we estimate the β_E , and the average of those is used in the CAPM model.

Válasza helytelen.

A helyes válasz:

For each of the peers, we deleverage their r_E , and calculate the average of those.**20 kérdés**
